

## Sharing the most promising solutions supporting communities and regions across Europe to become more resilient to climate change

The impacts of climate change are increasingly frequent, resulting in economic losses, environmental degradation and affecting health and well-being of people all around Europe – and globally-, highlighting the need to find *adaptation strategies* on top of *mitigation strategies*.

Communities, cities and regions are key catalysers where these strategies can be implemented: **REGILIENCE** supports them in their efforts towards building climate resilient pathways. The project will facilitate the identification and upscaling of the most promising resilience solutions.

The goals and vision of the project are aligned with the targets of the Green Deal and Horizon Europe Mission “Adaptation to Climate Change”.

**Understanding and addressing local and regional needs** to develop adaptation strategies, through a needs assessment.

**Connecting people and ideas:** REGILIENCE designs strategies on how best to exchange knowledge and results, from projects and experiences.

**Building local and regional capacity** for all involved in the development of regional resilience pathways through a helpdesk, peer to peer mentorship, and much more.

**Strengthening resilience in 10 vulnerable and low-capacity regions** by co-designing regional resilience pathways, replicating good practices with regional stakeholders and authorities.

**Engaging with citizens and fostering awareness**, through training activities, a chat and forum as well as other direct support actions customised based on their needs and inputs.

**Clustering and collaboration:** sharing results and lessons learned in the 3 Innovation Action projects to a wide audience, with actions, tools and informational material in various formats and languages.

### Partners and collaboration with other projects

REGILIENCE is ongoing from November 2021 for 48-month project and implemented by 9 partners.

The project works closely with 3 other projects, referred to as Innovation Actions, to amplify the reach and impact of results, coordinate actions and maximise benefits for communities impacted by climate change: ARSINOE, IMPETUS and TransformAr.
